

INTERNAL WALL GLADDING

TSI ENGINEERING

TSI Engineering Sdn Bhd was formed in 1993 to provide a selected range of specialised building products to the Malaysian building industry and support the expanding business activities of its parent company, TSI Group Malaysia. With many years of solid experience in the industry, TSI Engineering Sdn Bhd has developed a comprehensive range of surface protection system for the hospital industry. Called the 'Wal Guard Surface Protection System', the product offers a new solution to a perennial problem in hospitals i.e. damages found on doors, walls, kiosks, lifts, counters, or areas subjected to constant wear and tear, resulting from high pedestrian and trolley usage.

The Wal Guard Surface Protection System offers a wide range of products that are designed to protect the interior wall systems of a building and minimise damage. The Wal Guard Surface Protection System is manufactured under strict quality control standards and using the best available materials. TSI Engineering Sdn Bhd has implemented a Quality System programme, which complies with MS ISO 9001:2000 Quality Management Systems implemented by SIRIM QAS Sdn Bhd. The scope of registration includes provision of specialist contracting services such as Raised Floors, Wall Protection System, Hygienic Coating, Expansion Joint Cover System and Cubicle Curtain Track.

Through its various R&D programmes, TSI Engineering Sdn Bhd is committed to introducing new and innovative surface protection system for the hospital industry. TSI Engineering Sdn Bhd provides complete solutions to assist customers in addressing their most demanding requirements.

The company's recent projects include a major government hospital called Sungai Petani Hospital in the northern state of Kedah, Malaysia. Construction on the hospital started in March 2005 and is now nearly completed. For this project, TSI Engineering Sdn Bhd installed its Wal Guard Surface Protection System in nearly every corridor of the hospital building including the medical block and main building. The Wal Guard system was chosen as it enabled the hospital management to reduce maintenance cost in the long run.
